September 28, 2026

Letter of Recommendation for Sanvir Singh:

I highly recommend Sanvir Singh as a participant for admittance to your university to study engineering. He is an outstanding young man who already has a keen interest and skills necessary to become an excellent engineer. I am the NASA High School Students United with NASA to Create Hardware (HUNCH) mentor for Somerset County Vocational and Technical High School in Bridgewater, NJ. as well as the Northeastern and Northwestern regions of the U.S.. Sanvir joined the first after-school club for HUNCH at the school in 2024. It is a true pleasure to mentor Sanvir for these past years.

Sanvir is a highly dedicated young man who was instrumental in starting HUNCH as the volunteer after-school program. Since 2024 he has been a valued team member that helped the success of several challenging NASA HUNCH projects. Sanvir has found that HUNCH has allowed him to do real engineering on problems rather than just studying them in the classroom. HUNCH has also helped him gain an appreciation for the importance of teamwork, communication, research, testing, and product quality during the design and development of the HUNCH projects. Sanvir appreciates the opportunity to work on designs that could potentially be used on a NASA mission which helps him better to understand engineering. This interest is exactly what HUNCH hopes to cultivate in its students. Below are the projects that Sanvir participated in while in HUNCH.

2024–2025 — Lunar Ejecting Robot

His first HUNCH project was the Lunar Ejecting Robot. This project involved designing a robot that would capture real-time, high-definition photos of a rocket landing on the lunar surface. Sanvir performed testing, ensured product quality, created presentation materials, and researched materials and design alternatives for this project. He also helped with the electronics and programming where he applied his skills in computer science.

2025–2026 — Mars Trash Ejector

For the second year, he worked on the Mars Trash Ejector. This project involved creating an ejection and airlock system for use with the Mars Artemis Mission. Sanvir researched design and materials and alternative designs, prepared presentation materials, and assisted with parts for the ejection system and the 3D printing of parts for the system. His input led to the success of the trash ejector.

CURRENT: 2026–2027 — Multi-Purpose Lunar Packing Boxes

This year Sanvir is working on a HUNCH project called the Multi-Purpose Lunar Packing Boxes. He and the team are still deciding how to approach the project. However, Sanvir's main roles will be to perform testing, ensure product quality, prepare presentations, and research design and materials to determine the optimal design and materials for the project.

Throughout Sanvir's time in HUNCH he has found that he enjoys applying engineering and technology to solve challenging problems. HUNCH has been great in allowing him to work on technically oriented and team-oriented projects and has inspired him to pursue engineering both in college and as a career,

I am extremely proud of Sanvir and feel very fortunate to have him participate in the NASA HUNCH Program. Sanvir has made significant contributions to the HUNCH projects. His dedication to engineering

and technology makes him a perfect candidate for the study of engineering. Sanvir receives my highest recommendation. Please feel free to contact me at any time about this truly exceptional young man.

Sincerely,

Florence Gold, Ed.D.
NASA HUNCH Academy Project Manager
